

What is claimed is:

1. A semiconductor display device comprising:

an active matrix circuit having a plurality of pixel TFTs arranged in a matrix;

and

5 a data line driver circuit and scanning line driver circuits having a plurality of TFTs for driving said active matrix circuit,

wherein each of active layers of the plurality of pixel TFTs and each of active layers of the plurality of TFTs of the data line driver circuit and scanning line driver circuits is crystallized by a catalytic element, and

10 wherein the catalytic element is selectively gettered with a gettering element.
